SOLUTIONS

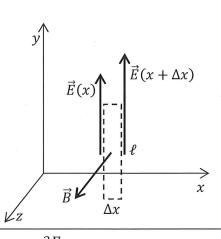

First, let's see how a change in \vec{B} will affect \vec{E} .

We'll make a rectangular loop Δx wide by ℓ high, and evaluate Faraday's law:

$$\oint \vec{E} \cdot \overrightarrow{ds} = -\frac{\partial \Phi_B}{\partial t}$$

Go around counter-clockwise, starting on left leg:

$$-E(x)\ell + 0\Delta x + \underbrace{E(x + \Delta x)}_{\ell} \ell + 0\Delta x = -\frac{\partial (B\Delta x \ell)}{\partial t}$$

$$E(x + \Delta x) = E(x) + \frac{\partial E}{\partial x} \Delta x \text{ (from your calc class)}$$

$$-E(x)\ell + \left(E(x) + \frac{\partial E}{\partial x} \Delta x\right)\ell = -\frac{\partial (B\Delta x \ell)}{\partial t}$$

$$-E(x)\ell + E(x)\ell + \frac{\partial E}{\partial x} \Delta x\ell = -\Delta x \ell \frac{\partial B}{\partial t}$$

$$\frac{\partial E}{\partial x} = -\frac{\partial B}{\partial t}$$

Call this equation (1)

Now you try it! Let's see how a change in \vec{E} will affect \vec{B} .

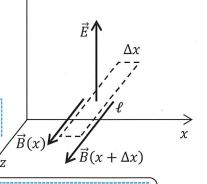

We'll make a rectangular loop Δx wide by ℓ deep, and evaluate Ampère's law:

$$\oint \vec{B} \cdot \overrightarrow{ds} = \mu_0 I_{ENC} + \mu_0 \epsilon_0 \frac{\partial \Phi_E}{\partial t}$$

Go around counter-clockwise, starting on left leg:

$$B(x)\ell + 0\Delta x + -\beta(x + \Delta x)\ell + 0\Delta x = 0 + \mu_0 \epsilon_0 \frac{\partial x}{\partial t}$$

$$B(x + \Delta x) = B(x) + \frac{\partial B}{\partial x} \Delta x$$

$$B(x) l - (B(x) + \frac{\partial B}{\partial x} \Delta x) l = \mu_0 c_0 \Delta x l \frac{\partial E}{\partial t}$$

$$B(x) l - B(x) - \frac{\partial B}{\partial x} \Delta x l = \mu_0 c_0 \Delta x l \frac{\partial E}{\partial t}$$

$$\frac{\partial B}{\partial x} = -\mu_0 \epsilon_0 \frac{\partial E}{\partial t}$$

Call this equation (2)

Now we will separate \vec{E} and \vec{B} :

• Start with equation (1):

$$\frac{\partial E}{\partial x} = -\frac{\partial B}{\partial t}$$

• Take $\partial/\partial x$ of both sides

$$\frac{\partial}{\partial x}\frac{\partial E}{\partial x} = \frac{\partial}{\partial x}\left(-\frac{\partial B}{\partial t}\right)$$

• Switch the order of the derivatives:

$$\frac{\partial^2 E}{\partial x^2} = -\frac{\partial}{\partial t} \left(\frac{\partial B}{\partial x} \right)$$

• Substitute for $\partial B/\partial x$, from equation (2):

$$\frac{\partial^2 E}{\partial x^2} = -\frac{\partial}{\partial t} \left(-\mu_0 \epsilon_0 \frac{\partial E}{\partial t} \right)$$

• Simplify:

$$\frac{\partial^2 E}{\partial x^2} = \mu_0 \epsilon_0 \frac{\partial^2 E}{\partial t^2}$$

Now you try it:

• Start with equation (2):

$$\frac{\partial B}{\partial x} = -\mu_0 \epsilon_0 \frac{\partial E}{\partial t}$$

• Take $\partial/\partial x$ of both sides

$$\frac{\partial}{\partial x} \frac{\partial B}{\partial x} = \frac{\partial}{\partial x} \left(-\mu_0 \epsilon_0 \frac{\partial E}{\partial \epsilon} \right)$$

• Switch the order of the derivatives:

$$\frac{\partial^2 B}{\partial z^2} = -4.60 \frac{\partial^2 E}{\partial z}$$

• Substitute for $\partial E/\partial x$, from equation (1):

$$\frac{\partial^2 \mathcal{B}}{\partial x^2} = -\mu_0 \epsilon_0 \frac{\partial}{\partial \epsilon} \left(\frac{\partial \mathcal{B}}{\partial \epsilon} \right)$$

• Simplify:

$$\frac{\partial^2 B}{\partial x^2} = \mathcal{M}_0 \mathcal{E}_0 \quad \frac{\mathcal{I}^2 \mathcal{B}}{\mathcal{I}^2}$$
